Explanation

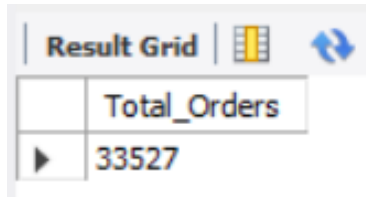

SELECT clause:

- MONTH(transaction_date) AS month: Extracts the month from the transaction_date column and renames it as month.

- `ROUND(SUM(unit_price * transaction_qty)) AS total_sales`: Calculates the total sales by multiplying `unit_price` and `transaction_qty`, then sums the result for each month. The `ROUND` function rounds the result to the nearest integer.
- `(SUM(unit_price * transaction_qty) - LAG(SUM(unit_price * transaction_qty), 1) OVER (ORDER BY MONTH(transaction_date))) / LAG(SUM(unit_price * transaction_qty), 1) OVER (ORDER BY MONTH(transaction_date)) * 100 AS mom_increase_percentage` with the functions used:
 - `SUM(unit_price * transaction_qty)`: This calculates the total sales for the current month. It multiplies the `unit_price` by the `transaction_qty` for each transaction and then sums up these values.
 - `LAG(SUM(unit_price * transaction_qty), 1) OVER (ORDER BY MONTH(transaction_date))`: This function retrieves the value of the total sales for the previous month. It uses the `LAG` window function to get the value of the `SUM(unit_price * transaction_qty)` from the previous row (previous month) ordered by the `transaction_date`.
 - `(SUM(unit_price * transaction_qty) - LAG(SUM(unit_price * transaction_qty), 1) OVER (ORDER BY MONTH(transaction_date)))`: This part calculates the difference between the total sales of the current month and the total sales of the previous month.
 - `LAG(SUM(unit_price * transaction_qty), 1) OVER (ORDER BY MONTH(transaction_date))`: This function retrieves the value of the total sales for the previous month again. It's used in the denominator to calculate the percentage increase.
 - `(SUM(unit_price * transaction_qty) - LAG(SUM(unit_price * transaction_qty), 1) OVER (ORDER BY MONTH(transaction_date))) / LAG(SUM(unit_price * transaction_qty), 1) OVER (ORDER BY MONTH(transaction_date))`: This calculates the ratio of the difference in sales between the current and previous months to the total sales of the previous month. It represents the percentage increase or decrease in sales compared to the previous month.
 - `100`: This part multiplies the ratio by 100 to convert it to a percentage.
- `FROM` clause:
`coffee_shop_sales`: Specifies the table from which data is being selected.
- `WHERE` clause:
`MONTH(transaction_date) IN (4, 5)`: Filters the data to include only transactions from April and May.
- `GROUP BY` clause:
`MONTH(transaction_date)`: Groups the results by month.
- `ORDER BY` clause:
`MONTH(transaction_date)`: Orders the results by month.

TOTAL ORDERS

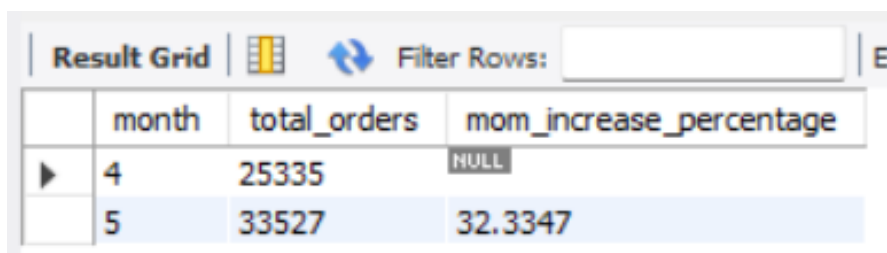

```

The screenshot shows a database interface with a 'Result Grid' tab. It contains a single row with the column 'Total_Quantity_Sold' and the value '48233'.

	Total_Quantity_Sold
▶	48233

TOTAL QUANTITY SOLD KPI - MOM DIFFERENCE AND MOM GROWTH

```
SELECT
    MONTH(transaction_date) AS month,
    ROUND(SUM(transaction_qty)) AS total_quantity_sold,
    (SUM(transaction_qty) - LAG(SUM(transaction_qty), 1)
    OVER (ORDER BY MONTH(transaction_date))) / LAG(SUM(transaction_qty), 1)
    OVER (ORDER BY MONTH(transaction_date)) * 100 AS mom_increase_percentage
FROM
    coffee_shop_sales
WHERE
    MONTH(transaction_date) IN (4, 5) -- for April and May
GROUP BY
    MONTH(transaction_date)
ORDER BY
    MONTH(transaction_date);
```

The screenshot shows a database interface with a 'Result Grid' tab. It contains two rows of data for months 4 and 5. The columns are 'month', 'total_quantity_sold', and 'mom_increase_percentage'.

	month	total_quantity_sold	mom_increase_percentage
▶	4	36469	NULL
	5	48233	32.2575

CALENDAR TABLE – DAILY SALES, QUANTITY and TOTAL ORDERS

SELECT

SUM(unit_price * transaction_qty) AS total_sales,

SUM(transaction_qty) AS total_quantity_sold,

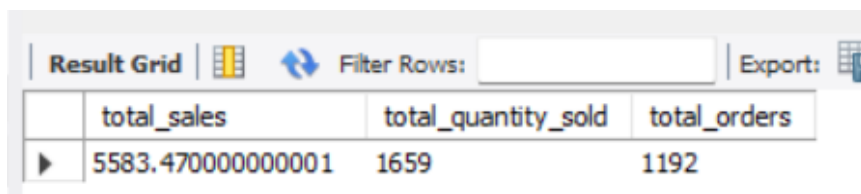

COUNT(transaction_id) AS total_orders

FROM

coffee_shop_sales

WHERE

transaction_date = '2023-05-18'; --For 18 May 2023

	total_sales	total_quantity_sold	total_orders
▶	5583.470000000001	1659	1192

If you want to get exact Rounded off values then use below query to get the result:

SELECT

CONCAT(ROUND(SUM(unit_price * transaction_qty) / 1000, 1),'K') AS total_sales,

CONCAT(ROUND(COUNT(transaction_id) / 1000, 1),'K') AS total_orders,

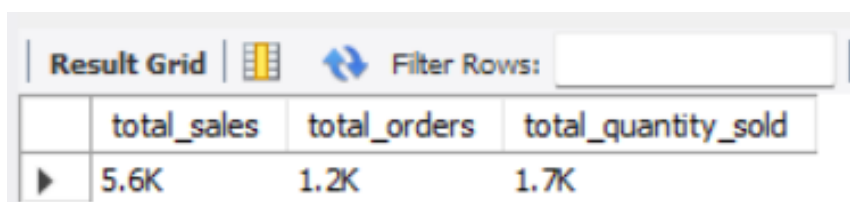

CONCAT(ROUND(SUM(transaction_qty) / 1000, 1),'K') AS total_quantity_sold

FROM

coffee_shop_sales

WHERE

transaction_date = '2023-05-18'; --For 18 May 2023

	total_sales	total_orders	total_quantity_sold
▶	5.6K	1.2K	1.7K

SALES TREND OVER PERIOD

```
SELECT AVG(total_sales) AS average_sales
FROM (
    SELECT
        SUM(unit_price * transaction_qty) AS total_sales
    FROM
        coffee_shop_sales
    WHERE
        MONTH(transaction_date) = 5 -- Filter for May
    GROUP BY
        transaction_date
) AS internal_query;
```

Query Explanation:

- This inner subquery calculates the total sales (unit_price * transaction_qty) for each date in May. It filters the data to include only transactions that occurred in May by using the MONTH() function to extract the month from the transaction_date column and filtering for May (month number 5).
- The GROUP BY clause groups the data by transaction_date, ensuring that the total sales are aggregated for each individual date in May.
- The outer query calculates the average of the total sales over all dates in May. It references the result of the inner subquery as a derived table named internal_query.
- The AVG() function calculates the average of the total_sales column from the derived table, giving us the average sales for May.

The screenshot shows a database interface with a 'Result Grid' tab. The grid contains one row with two columns. The first column is labeled 'average_sales' and the second column contains the value '5055.7341935483855'. There is a 'Filter Rows' button to the right of the grid.
